

Games, Puzzles & Computation

Notes: Week 3/20/2017 - 3/24/2017

Group G: Nancy Vidales, Israel Cabello, Arnold Ramirez, Eduardo

Game: Hedging Edges

- The board is a planar graph
- The move is labeling an edge with a unit square label (one label per edge)
- Examples:

- Impartial game
 - Every position has a value

$$\left| \begin{array}{c} \circ \\ | \\ \circ \end{array} \right| \equiv \{ _ \} \equiv \{ *0 \} \equiv *1$$

$$\begin{array}{c} \circ \\ | \\ \circ - \circ \\ | \\ \circ \end{array} \equiv \left\{ \begin{array}{c} \circ \\ | \\ \square - \circ \\ | \\ \circ \end{array} \right\}$$

$$\begin{array}{c} \circ \\ | \\ \square - \circ \\ | \\ \circ \end{array} \equiv \left\{ \begin{array}{c} \circ \\ | \\ \square - \square \\ | \\ \circ \end{array}, \begin{array}{c} \circ \\ | \\ \square - \square \\ | \\ \circ \end{array}, \begin{array}{c} \circ \\ | \\ \square - \square \\ | \\ \circ \end{array}, \begin{array}{c} \circ \\ | \\ \square - \square \\ | \\ \circ \end{array}, \begin{array}{c} \circ \\ | \\ \square - \square \\ | \\ \circ \end{array} \right\}$$

$$\begin{array}{c} \circ \\ | \\ \square - \square \\ | \\ \circ \end{array} \equiv \left\{ \begin{array}{c} \circ \\ | \\ \square - \square \\ | \\ \circ \end{array}, \begin{array}{c} \circ \\ | \\ \square - \square \\ | \\ \circ \end{array}, \begin{array}{c} \circ \\ | \\ \square - \square \\ | \\ \circ \end{array} \right\} \equiv *1$$

$$\begin{array}{c} \circ \\ | \\ \square - \square \\ | \\ \circ \end{array} \equiv \left\{ \begin{array}{c} \circ \\ | \\ \circ - \circ \\ | \\ \circ \end{array} \right\} \equiv \{ *0 \} \equiv *1$$

Complexity

- Question:
 - Given a position in the Hedging Edges game, is it possible to label all the remaining edges?

Reduction: reduce from planar 3-SAT

- Variable Gadget

- Propagation gadget: move info from one part to the other

- Turning Gadget

- Clause Gadget

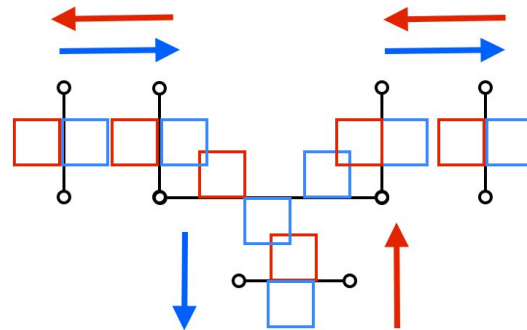

Figure 2: Encoding the clause of a Boolean formula; here $\bar{x} \vee y \vee \bar{z}$

Moving to QBF

What do we know?

$P \subseteq NP \subseteq PSPACE \subseteq EXPTIME \subseteq NEXPTIME \subseteq EXPSPACE$

$NPSPACE = PSPACE$

$P \not\subseteq EXPTIME$

QBF: Quantified Boolean Formula

- Basically just SAT as a game
- For $Sat \phi (X_1, X_2, \dots, X_n) = (X_1 \vee \neg X_3 \vee X_4 \vee X_2) \forall X_1$
 - NP, the certificate is a setting of variables (there exist a setting)
 - coNP (complement of NP), that no setting of the variables make ϕ true. For all settings)

Alternation

- A non-deterministic computation accepts if any one of the branches accepts
- equivalent to an “or” function
- Alternating Computation
 - Nodes can be designated “or” or “and” when a split happens
- Nodes can be “and”
 - all end states must accept from split of “and” vertex

The Polynomial Hierarchy

- Alternating computation yields a natural hierarchy of classes within PSPACE
- Σ_i - i levels of alternation $\exists \forall \exists \forall \dots$
- Π_i - i levels but starting with \forall : $\forall \exists \forall \exists \dots$

- How do we show that something is PSPACE-complete?

PSPACE-Complete

1. Show \in PSPACE

2. Every A in PSPACE is polynomial time reducible to our problem

Reduce PSPACE-complete problem to your problem

Fully quantified - every variable appears with a quantifier.

TQBF = $\{ \langle \emptyset \rangle \mid \emptyset \text{ is true fully quantified Boolean formula} \}$

Thm. TQBF is PSPACE-Complete.

The Formula Game

- Artificial game based on TQBF.
- Given $\emptyset = \exists x_1 \forall x_2 \exists x_3 \forall x_4 \exists x_5 \dots Qx_k [\Psi]$
- Q is either \exists , or \forall .
- Ψ is some boolean formula with $x_1 \dots x_k$

- Player A selects x_1 is T/F
- Player B selects x_2 is T/F
- After all k variables are set:
A wins if Ψ is true, B wins if Ψ is false.

- Ex.
 $\exists x_1 \forall x_2 \exists x_3 [(x_1 \vee x_2) \wedge (x_2 \vee x_3) \wedge (x_2 \vee x_3)]$

P1 wins if both play optimally.
